WEEK 7 INTERNSHIP PROGRESS REPORT

Remote Internship at FlyRank AI

STUDENT INFORMATION

University Name	University of Haripur
Student Name	Muhammad Abdullah Awan
Roll Number	F23-0332
Department	Department of Information Technology
Program	BS Artificial Intelligence
Semester	7th Semester
Company	FlyRank AI
Internship Type	Remote Internship
Internship Duration	July 2026 – August 2026 (8 Weeks)
Report Period	Week 7 (August 12 – August 18, 2026)

Submitted To:

Dr. Dawar Khan

Submitted By:

Muhammad Abdullah Awan

1. Introduction

FlyRank AI is an AI-powered organic growth platform that helps businesses improve their visibility across traditional search engines and AI answer engines such as ChatGPT, Perplexity, and Gemini. The platform automates large parts of the content lifecycle - research, scoring, and optimization - primarily serving D2C, SaaS, and agency clients who need scalable organic growth.

This report covers Week 7 of my remote Machine Learning Engineering internship at FlyRank AI, under the Applied Search Intelligence track. It summarizes the assignment completed, the reasoning behind it, and the skills developed.

2. Objective of Week 7

Objective: To turn the validated Week 5/6 model output into a clear, human-reviewed content action playbook with known limits - the same structure that becomes the recommendations section of the deployed research paper in the following week.

3. Week 7: Content Action Playbook

Task Requirements: Build ranked actions with reason codes and an archetype-to-action mapping; document intended use and limits, human-review rules, and an explicit no-go list of what should not be automated; define light monitoring and retrain triggers; export the ranked queue and reusable figures/metrics for the paper.

Research Performed: Reviewed this week's session material on translating a validated model into an operational playbook, and studied FlyRank's own paper structure (Priority Actions, Quick Wins Checklist) as a reference for how a practical, non-production playbook should read.

Summary of Work Completed: Generated a ranked action queue directly from the Week 5 model, mapping each page to a reason code (e.g. stale_but_visible_high_risk, page1_ctr_gap, model_flagged_decline_risk) and an action (refresh_priority, review_snippet_title, review_for_refresh, monitor_only, no_action). Documented intended use and limits using claim-ladder-safe language, explicitly naming the dataset's active-content survivor filter and the observational (non-experimental) nature of any 'decline' flag. Wrote human-review rules requiring editor sign-off on every action, plus an explicit 5-item no-go list covering auto-publishing, de-indexing decisions, treating unflagged pages as permanently safe, cross-client score comparison, and presenting scores without their Precision@50/base-rate context. Defined a light monitoring plan (tracking Precision@50 drift and reason-code distribution shifts) and concrete retrain triggers. Exported the ranked queue CSV (regenerated per run, kept out of git per the CI leak-guard), committed a reusable action-distribution figure to work/figures/, and committed the metrics JSON receipts to work/outputs/ as the numbers the next week's paper will trace back to.

What Was Learned: Learned that a model score is not a finished product - it only becomes useful once translated into ranked, reviewable actions with reasoning attached. Also learned that explicitly writing a 'no-go' list is as important as writing the recommended actions, since naming what should not be automated protects against overreach just as much as the recommendations protect productivity.

4. Skills Developed

Week 7 contributed to the development of the following technical, analytical, and professional skills:

Skill	Description
Playbook Design	Translated a validated model's output into ranked, human-reviewable actions with reason codes.
Risk Communication	Wrote an explicit no-go list naming realistic misuse scenarios, not just the intended use case.
Monitoring Design	Defined concrete, measurable monitoring and retrain triggers rather than vague 'keep an eye on it' guidance.
Reproducible Exports	Committed lightweight receipts (figures, metrics JSON) instead of large regenerable data files, keeping the repository clean while preserving reproducibility.

5. Challenges Faced

- › Balancing genuine usefulness (concrete ranked actions a reviewer can act on) against overclaiming, avoiding any language that suggests the model guarantees results.
- › Deciding what belonged on the no-go list required thinking through realistic misuse scenarios beyond the intended use case, not just restating the intended use in negative form.

6. Knowledge and Experience Gained

Week 7 provided practical experience in the last mile of applied ML work - the step most tutorials skip - where a validated model score is translated into something a real editor could act on safely, with explicit guardrails around what should not be automated.

7. Conclusion

Week 7 completed the applied half of the capstone: a ranked, reason-coded action playbook with explicit human-review rules, a no-go list, and monitoring triggers, built directly on the honestly-validated Week 5/6 model. The exported figures and metrics now form the receipts the deployed research paper will build on.

Looking ahead, the objective for the next reporting period is to deploy these findings as a public-facing research paper page, applying the same evidence standards practiced throughout this internship.
