WEEK 2 INTERNSHIP PROGRESS REPORT

Remote Internship at FlyRank AI

STUDENT INFORMATION

University Name	University of Haripur
Student Name	Muhammad Abdullah Awan
Roll Number	F23-0332
Department	Department of Information Technology
Program	BS Artificial Intelligence
Semester	7th Semester
Company	FlyRank AI
Internship Type	Remote Internship
Internship Duration	July 2026 – August 2026 (8 Weeks)
Report Period	Week 2 (July 8 – July 14, 2026)

Submitted To:

Dr. Dawar Khan

Submitted By:

Muhammad Abdullah Awan

1. Introduction

FlyRank AI is an AI-powered organic growth platform that helps businesses improve their visibility across traditional search engines and AI answer engines such as ChatGPT, Perplexity, and Gemini. The platform automates large parts of the content lifecycle - research, scoring, and optimization - primarily serving D2C, SaaS, and agency clients who need scalable organic growth.

This report covers Week 2 of my remote Machine Learning Engineering internship at FlyRank AI, under the Applied Search Intelligence track. It summarizes the assignment completed, the reasoning behind it, and the skills developed.

2. Objective of Week 2

Objective: To pick a provisional project lane and write a clear research-question framing before doing any modeling work, connecting the data available, the decision it improves, the action someone could take, and the cost of a wrong recommendation.

3. Week 2: Research Question Framing & Lane Selection

Task Requirements: Select one of four predefined project lanes (or propose a freestyle direction); write out the research question, the unit of analysis, the intended output, and the real-world action it supports; back the lane choice with real numbers computed directly from the starter dataset.

Research Performed: Reviewed FlyRank's dataset and lane guide to compare the four available project directions (ranking signal analysis, content refresh scoring, content clustering, and CTR/engagement scoring) against the data actually available and my own interests.

Summary of Work Completed: Selected the 'Refresh / Content Opportunity Scoring' lane - ranking which content pages should be reviewed first for a refresh. Backed the decision with real evidence from the starter dataset: 13,152 pages (43.8%) showed a genuine decline paired with real search demand, and the previously proven ~3x precision lift from a learned model over a fixed rule. Clearly defined the decision this work improves (which pages an editor should review first), who acts on it, and the cost of a wrong call in both directions - wasted review time versus a missed real decline.

What Was Learned: Learned that a strong ML project starts with a decision and an action, not a model - and that a proxy label (such as a current-window decline flag) must be clearly distinguished from an ideal, future-outcome label.

4. Skills Developed

Week 2 contributed to the development of the following technical, analytical, and professional skills:

Skill	Description
Problem Framing	Connected a data source to a real decision, an action, and the cost of a wrong recommendation before any modeling.
Evidence-Based Decision Making	Backed a project direction with real, computed numbers from the dataset rather than assumption.
Technical Writing	Documented reasoning clearly in structured markdown sections for review and reproducibility.

5. Challenges Faced

- › Choosing between multiple valid lanes: Comparing four legitimate project directions required weighing data availability against personal interest and feasibility within the timeline.
- › Avoiding vague framing: Ensuring the research question named a specific decision and action, rather than a general goal, took several revisions.

6. Knowledge and Experience Gained

Week 2 reinforced that in applied ML work, the choice of project direction should be justified with real evidence, not intuition alone, and that clearly naming the decision and action early prevents wasted effort later.

7. Conclusion

Week 2 moved from running an existing pipeline to framing an original research question. Selecting the Refresh/Content Opportunity Scoring lane, backed by real data evidence, set a clear and defensible direction for the remainder of the internship.

Looking ahead, the objective for the next reporting period is to formally map this lane onto a specific machine learning task type, target, and success metric.
