WEEK 3 INTERNSHIP PROGRESS REPORT

Remote Internship at FlyRank AI

STUDENT INFORMATION

University Name	University of Haripur
Student Name	Muhammad Abdullah Awan
Roll Number	F23-0332
Department	Department of Information Technology
Program	BS Artificial Intelligence
Semester	7th Semester
Company	FlyRank AI
Internship Type	Remote Internship
Internship Duration	July 2026 – August 2026 (8 Weeks)
Report Period	Week 3 (July 15 – July 21, 2026)

Submitted To:

Dr. Dawar Khan

Submitted By:

Muhammad Abdullah Awan

1. Introduction

FlyRank AI is an AI-powered organic growth platform that helps businesses improve their visibility across traditional search engines and AI answer engines such as ChatGPT, Perplexity, and Gemini. The platform automates large parts of the content lifecycle - research, scoring, and optimization - primarily serving D2C, SaaS, and agency clients who need scalable organic growth.

This report covers Week 3 of my remote Machine Learning Engineering internship at FlyRank AI, under the Applied Search Intelligence track. It summarizes the assignment completed, the reasoning behind it, and the skills developed.

2. Objective of Week 3

Objective: To translate the chosen project lane into a formally defined machine learning task - naming the task type, the target or proxy variable, the success metric, and the real unit of analysis - before any feature or model work begins.

3. Week 3: ML Task Framing

Task Requirements: Identify the correct ML task type (classification, clustering, ranking, or scoring) for the lane; define the target/proxy variable and justify it; choose a success metric that matches how the output will actually be used; build a small real dataframe demonstrating the unit of analysis.

Research Performed: Compared the lane's real-world question ('which pages should be reviewed first') against the standard ML task-type definitions to confirm that ranking/scoring - not plain classification - was the correct fit, since the output is an ordered list rather than a single yes/no label.

Summary of Work Completed: Formally defined the task as a ranking/scoring problem. Set the proxy target as `is_declining_label` (derived from the current trend direction), while explicitly noting its limitation as a current-window proxy rather than an ideal future-outcome label. Chose Precision@K (specifically Precision@50) as the success metric, since it reflects how a reviewer with limited time would actually use a ranked list. Built a real dataframe from the starter dataset showing the unit of analysis (one row per content page) alongside the sketched target column.

What Was Learned: Learned to name a task type, a target, and a metric before writing any modeling code - and that doing so up front makes it far easier to defend a project's design choices later, including why a fixed rule alone is not sufficient here.

4. Skills Developed

Week 3 contributed to the development of the following technical, analytical, and professional skills:

Skill	Description
ML Task Classification	Correctly mapped a business question onto a formal ML task type (ranking/scoring vs. classification).
Metric Selection	Chose a success metric (Precision@K) that matches real-world usage rather than a generic accuracy measure.
Data Structuring	Built a clean dataframe demonstrating the precise unit of analysis for the project.

5. Challenges Faced

- › Distinguishing task types: Understanding why the problem was ranking/scoring rather than classification required careful comparison of how the output would actually be used.
- › Being honest about the proxy label: Clearly documenting that the current-window label was a proxy, not the ideal target, required resisting the temptation to overstate the result.

6. Knowledge and Experience Gained

Week 3 reinforced that naming a task type, target, and metric precisely - before writing any modeling code - is what makes a project's later results defensible and comparable.

7. Conclusion

Week 3 formally mapped the chosen lane onto a ranking/scoring ML task, with a clearly justified target and success metric. This gave the project a precise technical foundation ahead of working with FlyRank's real data warehouse.

Looking ahead, the objective for the next reporting period is to write and verify a data contract directly against FlyRank's real production-scale data warehouse.
